

## bare lymphocyte syndrome type II

Bare lymphocyte syndrome type II (BLS II) is an inherited disorder of the immune system categorized as a form of combined immunodeficiency (CID). People with BLS II lack virtually all immune protection from bacteria, viruses, and fungi. They are prone to repeated and persistent infections that can be very serious or life-threatening. These infections are often caused by "opportunistic" organisms that ordinarily do not cause illness in people with a normal immune system.

BLS II is typically diagnosed in the first year of life. Most affected infants have persistent infections in the respiratory, gastrointestinal, and urinary tracts. Because of the infections, affected infants have difficulty absorbing nutrients (malabsorption), and they grow more slowly than their peers. Eventually, the persistent infections lead to organ failure. Without treatment, individuals with BLS II usually do not survive past early childhood.

In people with BLS II, infection-fighting white blood cells (lymphocytes) are missing specialized proteins on their surface called major histocompatibility complex (MHC) class II proteins, which is where the condition got its name. Because BLS II is the most common and best studied form of a group of related conditions, it is often referred to as simply bare lymphocyte syndrome (BLS).

### Frequency

BLS II is a rare condition. At least 100 cases have been reported in the medical literature. While BLS II has been found in several populations throughout the world, it appears to be especially prevalent in the Mediterranean region and North Africa.

### Genetic Changes

BLS II is caused by mutations in the *CIITA*, *RFX5*, *RFXANK*, or *RFXAP* gene. Each of these genes provides instructions for making a protein that plays a role in controlling the activity (transcription) of genes called MHC class II genes. Transcription is the first step in the production of proteins, and the *CIITA*, *RFX5*, *RFXANK*, and *RFXAP* proteins are critical for the production of MHC class II proteins from these genes.

The *RFX5*, *RFXANK*, and *RFXAP* proteins come together to form the regulatory factor X (RFX) complex, which attaches (binds) to specific regions of DNA involved in the regulation of MHC class II gene activity. The *CIITA* protein interacts with the RFX complex and brings together other proteins that turn on gene transcription, leading to the production of MHC class II proteins.

MHC class II proteins play an important role in the body's immune response to foreign invaders, such as bacteria, viruses, and fungi. To help the body recognize and fight infections, MHC class II proteins on lymphocytes bind to fragments of proteins (peptides) from foreign invaders so that other specialized immune system cells can interact with them. When these immune system cells recognize the peptides as harmful, they trigger the lymphocytes to launch immune responses to get rid of the foreign invaders.

Mutations in the *CIITA*, *RFX5*, *RFXANK*, or *RFXAP* gene prevent transcription of MHC class II genes, which leads to an absence of MHC class II proteins on the surface of certain lymphocytes. Lack of these proteins on lymphocytes impairs the body's immune response to bacteria, viruses, and fungi, leading to persistent infections in individuals with BLS II syndrome.

### **Inheritance Pattern**

This condition is inherited in an autosomal recessive pattern, which means both copies of the gene in each cell have mutations. The parents of an individual with an autosomal recessive condition each carry one copy of the mutated gene, but they typically do not show signs and symptoms of the condition.

### **Other Names for This Condition**

- bare lymphocyte syndrome type 2
- BLS type II
- major histocompatibility complex class II deficiency
- MHC class II deficiency
- SCID due to absence of class II HLA antigens
- SCID, HLA class 2-negative
- SCID, HLA class II-negative
- severe combined immunodeficiency due to absent class II human leukocyte antigens
- severe combined immunodeficiency, HLA class II-negative
